

Dear Future Students:

In this course you will do a lot of math so hopefully math is your favorite subject!! This class requires a lot of time and patience. To be successful in this class it is important to be in class and lab when you have class, because if not you will miss a lot of important information. Also, make sure that you do all labs and homework assignments online, and go to the tutoring center or see Professor Yosko if you need help. Learning the material can be hard or easy. If you print out your notes in class and pay attention to the lecture, and then work the problems at home on your own you should be fine, but if not you will probably won't be as successful (maybe if you are smart and can do that!). The exams... If you prepare for them the right way which is by looking over your quizzes that you take, looking over notes, and homework. I personally was the kind of person that waited to study a night or two before the exam, and that didn't work out, and I didn't really ask questions about things that I didn't understand, and I probably could have did better on an exam than I did. If I could go back and change some of the things to be more prepared, I would have went to the tutoring center, and asked for help when needed, it is also a good idea to find someone in the class, and get together with them when you need help, and don't wait till the last minute to study for tests, and to study more effectively. This class was really tough for me because math is not my strongest subject. Like I said it takes a lot of time and patience, and you may even become stressed, but if you try your hardest, it is possible to be successful.
